

## Data Protection @AWS

### Seminar for medium-sized enterprises

Many medium-sized customers are showing interest in the AWS cloud. However, uncertainty and a lack of knowledge about the data protection aspects of AWS are preventing them from giving the solution the green light. There are many open questions regarding data protection, security, and compliance, and these cannot always be answered in purely technical terms.

In addition, the ability to trust cloud solutions from US providers has been damaged in particular in light of the US Cloud Act. The concern is that AWS, as a US provider, has access to customer data and customers could face data breaches and associated fines or reputational damage. These aspects must be addressed from a technical and legal point of view.

#### **We provide comprehensive advice: Data protection and AWS security**

Customer concerns about data protection in AWS will be addressed and discussed over two consecutive workshops.

The first workshop is dedicated to the topic of "data protection despite the use of US cloud providers". In particular, the legal situation and current interpretations of the authorities will be covered.

The second workshop concentrates on the topic of "data protection through AWS". Common AWS services will be explained to show how they ensure data protection (especially with regard to encryption).

#### **Your benefits**

This knowledge will allow your data protection officers to comprehensively understand the capabilities and advantages of the AWS cloud in the area of data protection.

The workshop helps customers and their data protection officers to discuss and understand FAQs on AWS and data protection in a structured manner.

After the workshop, participants will be able to initiate or continue cloud projects with the support of this newly gained knowledge about data protection

#### **Why Skaylink?**

- Skaylink has been very active in regulated industry for over 10 years.
- Our architects as well as IT security and compliance consultants have many years of practical experience working with data protection officers and the requirements of the GDPR.
- Skaylink is the first German-language AWS Security Competency Partner.
- We do not see data protection as a hurdle, but as an enabler.
- Security and privacy by design are the cornerstones of good architecture
