

AWS Security Assessment

Evaluation of the security posture of an AWS customer environment

Skaylink's AWS Security Assessment evaluates the security posture of your environment where you have already implemented AWS solutions. The roles, processes, practices, and configuration of AWS services are scrutinized in accordance with the previously agreed project scope.

The AWS Security Assessment is based on AWS CAF (Cloud Adoption Framework), and it includes topics on data protection, infrastructure, identity and access management, event detection, and responding to incidents. Similar to a well-architected review (AWARE), this is not an audit, penetration, or compliance test.

Take a holistic view of security through an AWS Security Assessment

The three main phases of the security assessment are interviews, technical information gathering, and the presentation of findings and recommendations for action. Interviews are used to collect information regarding the operation, construction, and maintenance of the security measures in a verbal format. These interviews consider both technical and organizational measures.

Technical information is collected with tools that check the security status in specified AWS accounts using read-only rights.

Findings from the interviews and the technical check are presented to the customer along with recommendations for action.

Your benefits

The AWS Security Assessment is consistent with the current best practices and experiences of AWS Professional Services and Skaylink. Different customer experiences contribute to continuous improvement.

A comprehensive picture of the security posture is created through the involvement of internal and external AWS experts as well as other internal stakeholders. Participants do not need to have any AWS expertise.

Under the aegis of a clear common goal, the customer gets an opportunity to exchange experiences about security in AWS across departments and improve the security posture. .

Work with an AWS partner from the very beginning

- Skaylink has been an experienced partner for regulated industry for more than 20 years.
- Our AWS security specialists have been audited by AWS Professional Services, and their performance and experience has been praised as "raising the bar".
- Skaylink is the first AWS Security Competency Partner in the German-speaking region (Germany, Austria, Switzerland).
- Skaylink is in close contact with AWS Professional Services, and it is continuously improving how it conducts security assessments.
